### **Table 2 Embodied Energy for Cement and Concrete Production**

## **Embodied Energy for Cement and Concrete Production**

	% by weight	<u>Btus per ton</u> <u>Materials</u> <u>Hauling</u>	Btus/yard concrete	Energy <u>%</u>
Cement	12%	5,792,000 504,000	1,574,000	94%
Sand	34%	5,000 37,000	29,000	1.7%
Crushed Stone	48%	46,670 53,000	100,000	5.9%
Water	6%	0 0	0	0%
Concrete	100%	817,600	1,700,000	100%

#### Notes:

Calculations of energy requirements for cement production based on figures supplied by the Portland Cement Association, 1990 data. Aggregate and hauling energy requirements based on data supplied by PCA and based on the following assumptions:

- Cement hauled 50 miles to ready-mix plant
- · Aggregate hauled 10 miles to plant
- · Concrete mix hauled 5 miles to building site
- · Concrete mix: 500 lbs. cement, 1,400 lbs. sand, 2,000 lbs. crushed stone, 260 lbs. water/yard.

#### Table 4 CO Emissions from Cement and Concrete Production

# CO<sub>2</sub> Emissions from Cement and Concrete Production

	lbs CO <sub>2</sub> per ton of cement	lbs CO <sub>2</sub> per cu. yd. of concrete	Percent of total CO <sub>2</sub>
CO <sub>2</sub> emissions from energy use	1,410	381	60
CO <sub>2</sub> emissions from calcining of limestone	997	250	40
Total CO <sub>2</sub> emissions	2,410	631	100

#### Notes:

Calculations of energy requirements for cement and concrete as in Table 2.

CO  $_{2}$  emissions from different fuels from ACEEE Consumer Guide to Home Energy Savings, 1991.

Estimates of emissions from calcining limestone from CO  $_2$  Release from Cement Production 1950-1985, by Richard Griffin, Institute for Energy Analysis, Oak Ridge Assoc. Universities, 8/87.
